Automatic Discharging
with continuously adjustment valve opening

► Valve opening mechanism

Manual opening of butterfly valves with lifted load, is often not possible without using aids such as mobile platforms. For this purpose, SERVOLIFT has added there portfolio by a controlled opening and closing device for container valves. The new mechanism allows continuous adjusting of interim positions as well as detection of the end positions (valve open/close).
The device is dismountable, cleanable and therefore convenient for GMP-conform environment. This system can be added to existing SERVOLIFT systems.

- **Control:** pneumatically / electrically
- **Opening Angle:** between 0° and 90°
- **Interim Position:** variable
- **Applicability:** SERVOLIFT - lifter and container
